

MICHAEL ALUSA LIMISI

Technical Support Engineer • AI Automation & Agentic Workflows

Nairobi, Kenya • [LinkedIn](#) • [GitHub](#) • [Portfolio](#)

PROFESSIONAL SUMMARY

Technical Support Engineer with 8+ years bridging software engineering and customer-facing support. I don't just resolve tickets — I build the systems that prevent them. Known for deep log analysis, creative API troubleshooting, and designing agentic AI workflows that scale support operations without scaling headcount. Currently specializing in agentic automation: building GPT-powered systems, multi-step Make.com pipelines, and self-healing support infrastructure for high-growth SaaS teams.

WORK EXPERIENCE

Technical Support Engineer | Arucy Enterprises, Nairobi, Kenya | *June 2024 – Present*

- Reduced support tickets by **30%** by performing deep log and API analysis to diagnose and resolve real-time webhook failures — often before customers noticed the issue.
- Built a **Human-in-the-Loop AI Support Agent** using Make.com and GPT-4 that drafts Tier 1 responses for human review, cutting manual typing by **40%** and stabilizing response times during peak load.
- Own end-to-end resolution of complex **Stripe billing disputes** and B2B SaaS escalations, managing full lifecycle from triage to close with a **95% CSAT** and strict SLA compliance.
- Designed internal self-serve tools and Notion SOPs that enabled the support team to absorb **5x YoY growth** without adding headcount.
- Built proactive monitoring workflows via **AWS CloudWatch** to detect anomalies in system logs for a 1M+ user base, reducing reactive firefighting.
- Collaborated closely with engineering via **Jira** for precise bug reporting and technical escalation, acting as the bridge between customer pain and engineering priority.

Software Developer | iTalanta, Nairobi, Kenya | *Oct 2023 – Apr 2024*

- Diagnosed and resolved **PostgreSQL performance bottlenecks** using SQL and log analysis, achieving a **30% reduction** in query response times.
- Contributed to pre-release validation cycles using Python and JavaScript — catching edge cases before they reached production.
- Rebuilt internal troubleshooting documentation from the ground up, reducing incoming support volume through better self-serve coverage.
- Applied support engineering best practices to system performance monitoring during customer migrations, ensuring near-zero downtime.

Senior Consultant & Technical Liaison | CustomMade, Massachusetts, USA (Remote) | *June 2018 – Aug 2024*

- Served as the **single point of contact** for high-value client projects — managing white-glove support through full delivery with a **98% satisfaction rating**.

- Handled complex technical escalations under deadline pressure: when a VIP client's design hit a structural constraint days before delivery, I ran a live collaborative session to engineer an alternative that preserved the original vision without compromising integrity.
- Applied systematic **root cause analysis** to resolve design and specification disputes — turning ambiguous client requirements into precise technical briefs.
- Improved cross-functional documentation and communication workflows, reducing rework on complex custom projects by improving requirement capture upstream.

FEATURED PROJECTS

Human-in-the-Loop AI Support Agent — *Make.com · OpenAI GPT-4*

Engineered an agentic workflow that automatically drafts Tier 1 support responses using GPT-4, then routes them to a human agent for review before sending. Reduced manual typing by 40% and maintained response quality during peak support hours. Designed with guardrails to flag edge cases requiring escalation.

Automated Knowledge Base Sync — *Jira · Notion · Make.com*

Built a system that detects newly closed Jira tickets and automatically extracts the solution, then pushes a formatted entry to the internal Notion knowledge base. Ensured the support team always had access to the latest troubleshooting steps — without anyone having to remember to document them.

Autonomous CRM & Task Agent (Voice/Text) — *Telegram · Make.com · Asana · Monday.com · Jira*

Eliminated up to 120 hours/year per person in manual CRM data entry by building an agentic AI system controlled entirely via Telegram voice notes or text. A manager can say 'Move the proposal to Done and create a follow-up task for next Wednesday, high priority' — and within milliseconds the agent finds the right task, moves the card, sets the date, and updates custom fields across Asana, Jira, or Monday.com. No app-switching, no typing. Built on Make.com with full agentic tool-use — the AI has hands, not just a voice.

WhatsApp Finance Tracker Agent — *WhatsApp · Make.com · PDF Analysis*

A personal finance agent that lives in WhatsApp. Share a bank statement PDF to set your baseline, then text any purchase — the agent logs it, updates your balance, and fires a budget alert when you're close to the limit. It also surfaces spending patterns and suggests specific cuts that could save \$200/month. Zero dashboards. Zero logins. Just a chat.

SKILLS & TOOLS

Agentic AI & Automation: Make.com, Zapier, OpenAI API, GPT-4, Prompt Engineering, Agentic Workflow Design

Diagnostics & Analysis: Log Analysis, Root Cause Analysis, API Logs, PostgreSQL, SQL, AWS CloudWatch

Engineering: Python, JavaScript, React, GitHub, Postman, Bug Reporting

Support Stack: Zendesk, Intercom, Jira, Notion SOPs, SLA Management, B2B SaaS Support

Operations: Self-serve Tools, Internal Automation, Scaling Support, Technical Documentation

EDUCATION

Certificate in Software Development | Moringa School, Nairobi, Kenya *Feb 2023 – Nov 2023*

B.Eng. Electrical Engineering & Electronics | NIT Warangal, India *Jan 2012 – Apr 2016*
